IMAGE PROCESSING

Pyramids

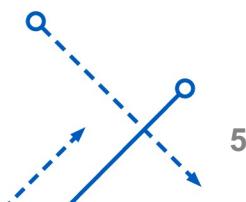

Image Pyramids

- Gaussian pyramid
- Laplacian pyramid
- Transposed Convolution

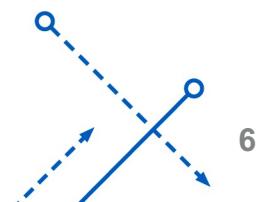

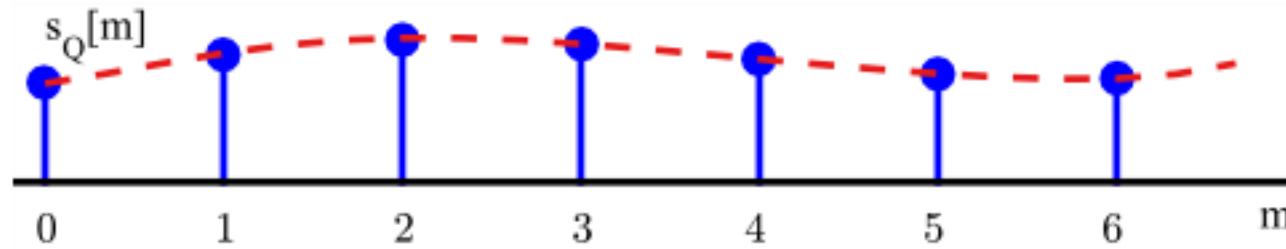

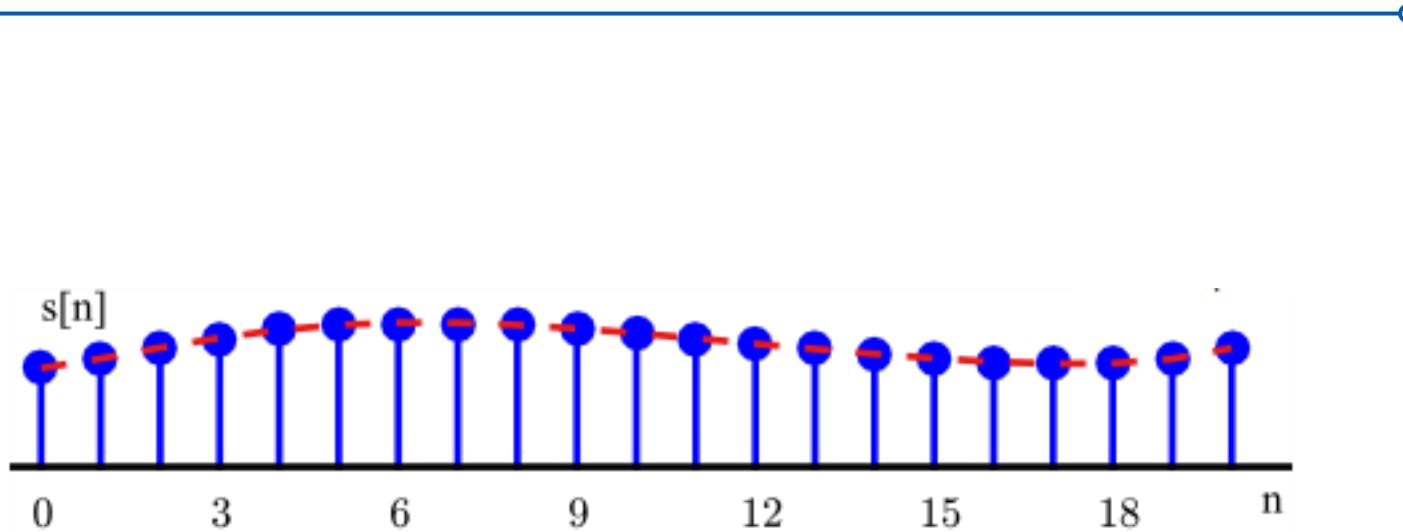

Pyramids applications

- Up- or Down- sampling images.
- Multi-resolution image analysis
 - Look for an object over various spatial scales
 - Coarse-to-fine image processing
 - form blur estimate or the motion analysis on very low-resolution image, up-sample and repeat.
 - Often a successful strategy for avoiding local minima in complicated estimation tasks.

Down-sampling

The Gaussian pyramid

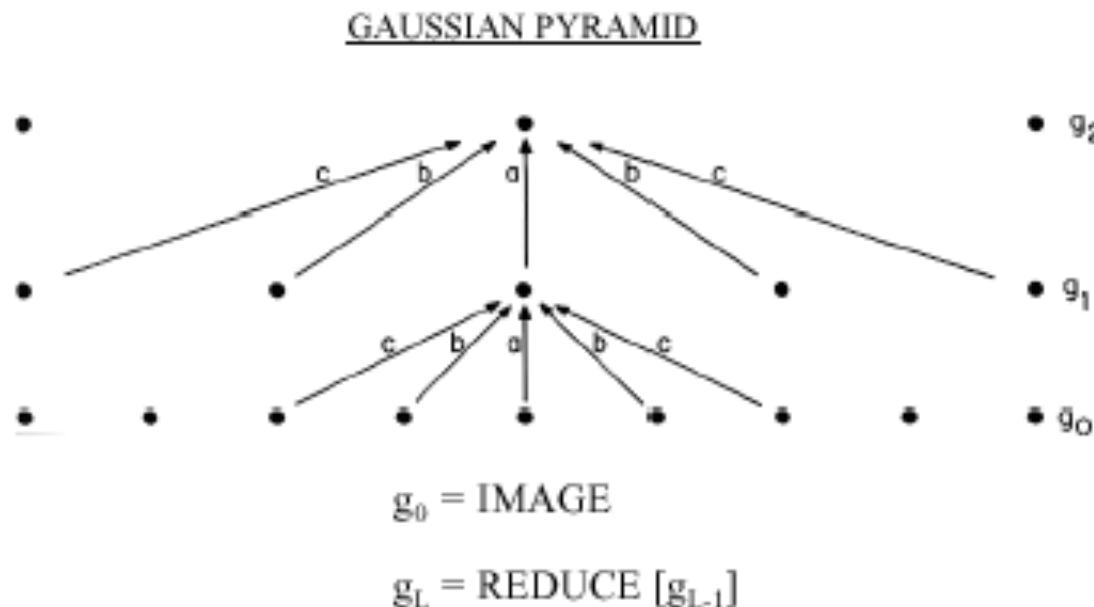

Fig 1. A one-dimensional graphic representation of the process which generates a Gaussian pyramid. Each row of dots represents nodes within a level of the pyramid. The value of each node in the zero level is just the gray level of a corresponding image pixel. The value of each node in a high level is the weighted average of node values in the next lower level. Note that node spacing doubles from level to level, while the same weighting pattern or "generating kernel" is used to generate all levels.

The Gaussian pyramid

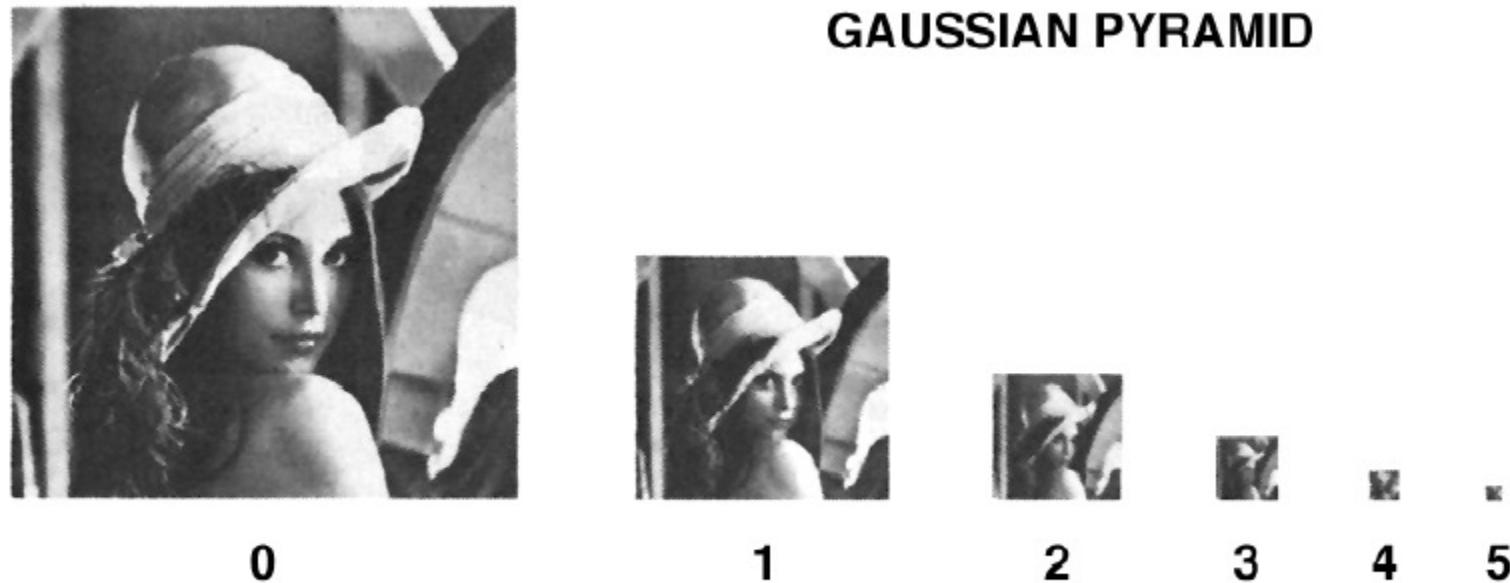

Fig. 4. First six levels of the Gaussian pyramid for the "Lady" image. The original image, level 0, measures 257 by 257 pixels and each higher level array is roughly half the dimensions of its predecessor. Thus, level 5 measures just 9 by 9 pixels.

The Gaussian pyramid

Matrix operation for Down-sampling (1D)

- Assume x_1 is a signal with 16 elements.
- Down-sampled signal x_2 can be expressed as

$$x_2 = G_1 x_1$$

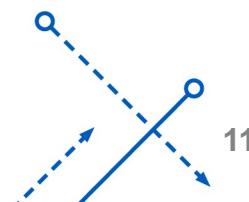

$$G_1 = \begin{matrix} 1 & 4 & 6 & 4 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 4 & 6 & 4 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 4 & 6 & 4 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 4 & 6 & 4 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 4 & 6 & 4 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 4 & 6 & 4 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 4 & 6 & 4 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 4 & 6 & 4 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 4 & 6 & 4 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 4 & 6 & 4 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 4 & 6 & 4 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 4 & 6 & 4 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 4 & 6 & 4 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 4 & 6 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 4 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{matrix}$$

(Normalization constant of 1/16 omitted for visual clarity.)

Next pyramid level

$$x_3 = G_2 x_2$$

$$G_2 = \begin{matrix} 1 & 4 & 6 & 4 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 4 & 6 & 4 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 & 4 & 6 & 4 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 4 \end{matrix}$$

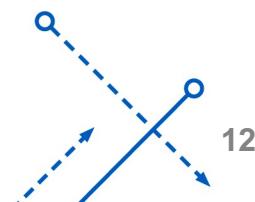

The combined effect of the two pyramid levels

- Smooth with Gaussians, because
 - a Gaussian * Gaussian = another Gaussian

$$x_3 = G_2 G_1 x_1$$

$$G_2 G_1 =$$

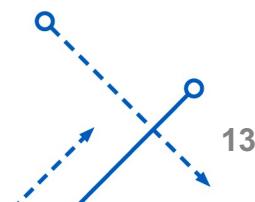

1	4	10	20	31	40	44	40	31	20	10	4	1	0	0	0	0	0	0	
0	0	0	0	1	4	10	20	31	40	44	40	31	20	10	4	1	0	0	
0	0	0	0	0	0	0	0	1	4	10	20	31	40	44	40	30	16	4	0
0	0	0	0	0	0	0	0	0	0	0	0	1	4	10	20	25	16	4	0

Up-sampling

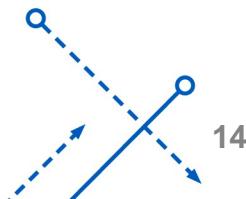

$$y_2 = F_3 x_3$$

$$F_3 = \begin{matrix} 6 & 1 & 0 & 0 \\ 4 & 4 & 0 & 0 \\ 1 & 6 & 1 & 0 \\ 0 & 4 & 4 & 0 \\ 0 & 1 & 6 & 1 \\ 0 & 0 & 4 & 4 \\ 0 & 0 & 1 & 6 \\ 0 & 0 & 0 & 4 \end{matrix}$$

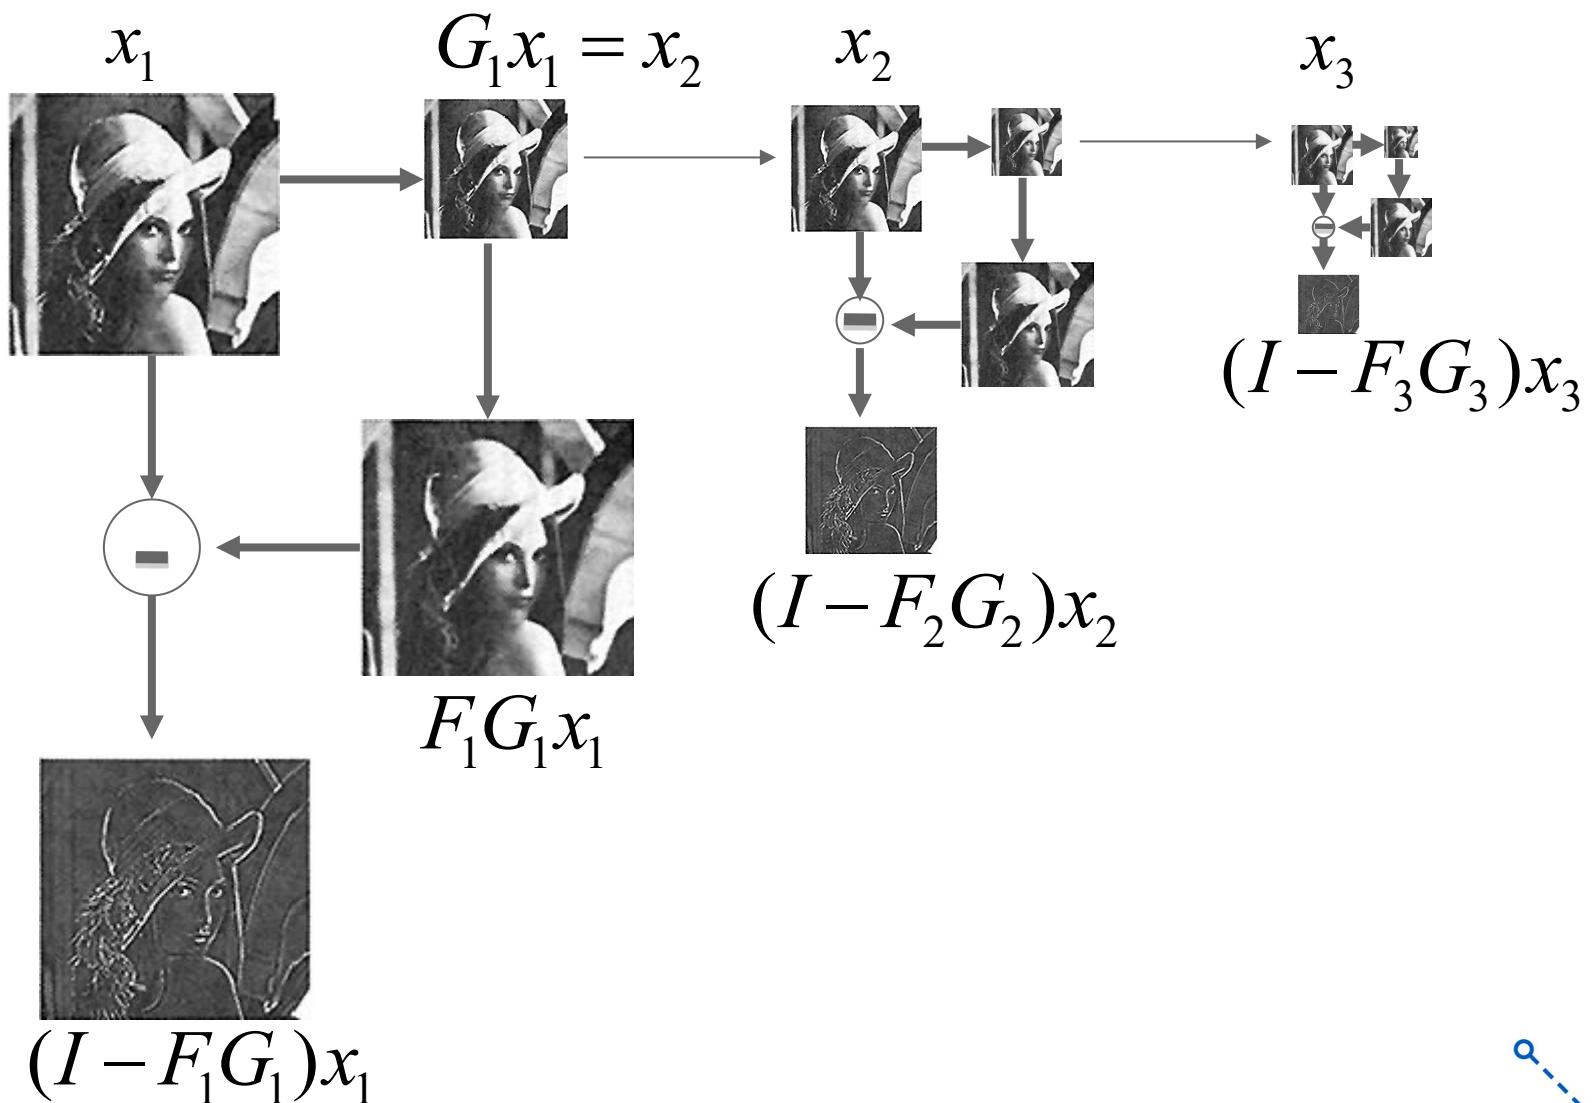

The Laplacian Pyramid

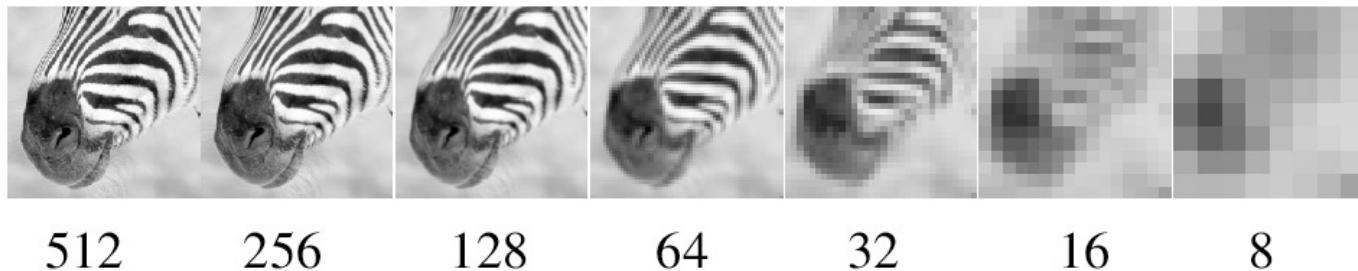

- **Difference between up-sampled Gaussian pyramid and Gaussian pyramid.**
- **Band pass filter** - each level represents spatial frequencies (largely) unrepresented at other level.

Laplacian pyramid algorithm

Gaussian pyramid

Laplacian pyramid

Laplacian Pyramid

- Information captured at each level of a Gaussian (top) and Laplacian (bottom) pyramid
 - showing full resolution.

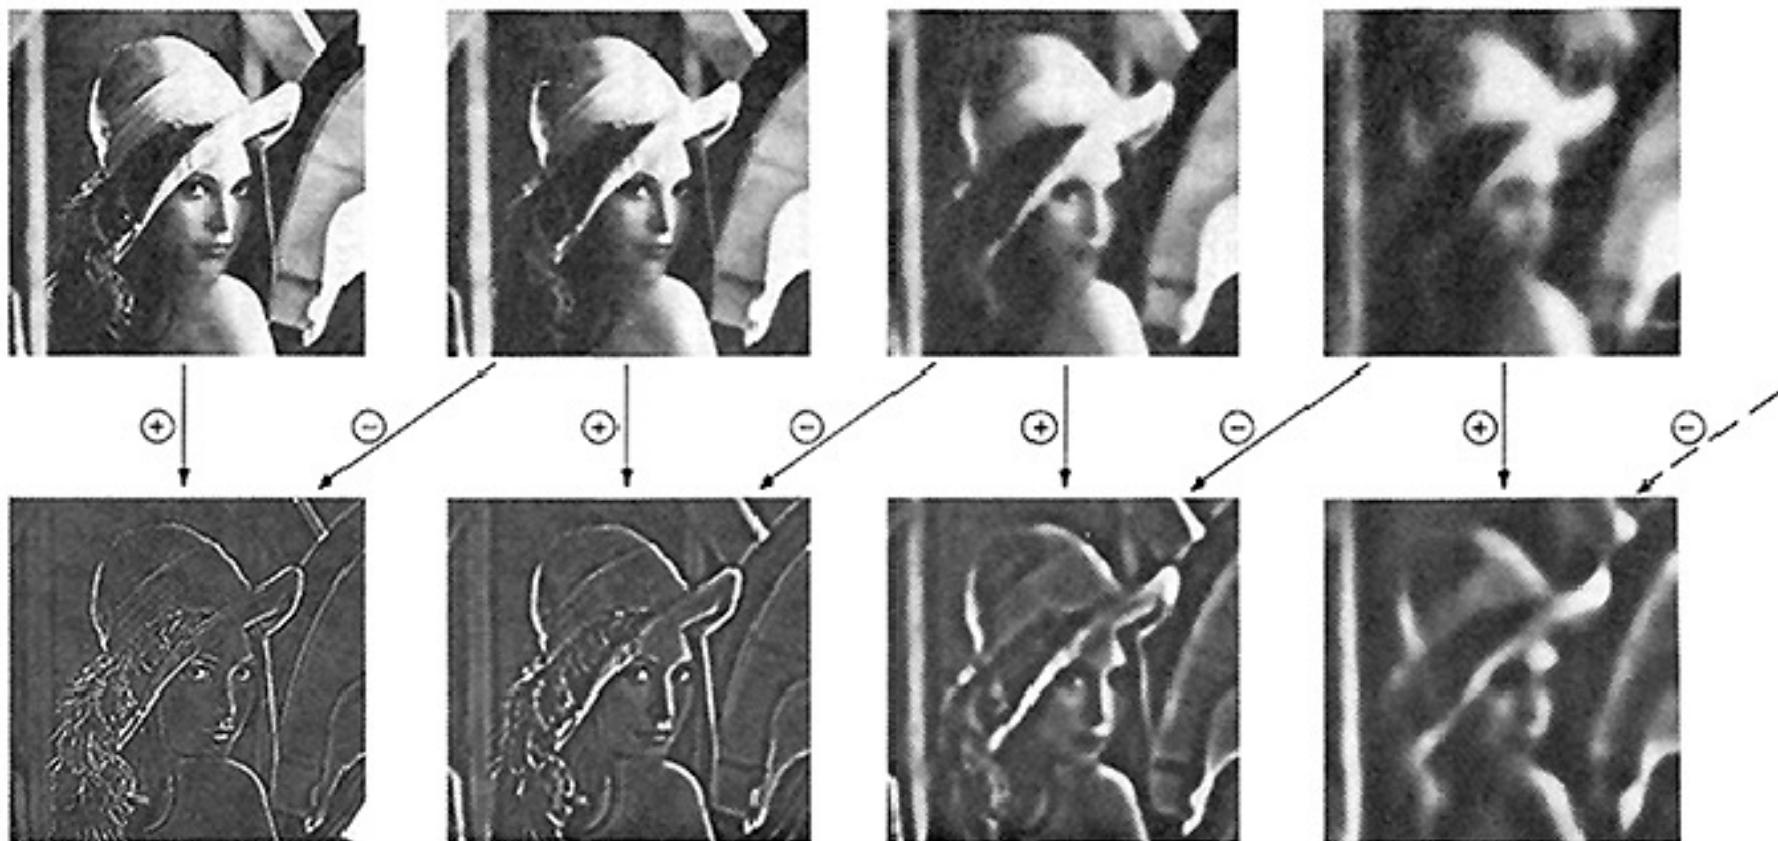

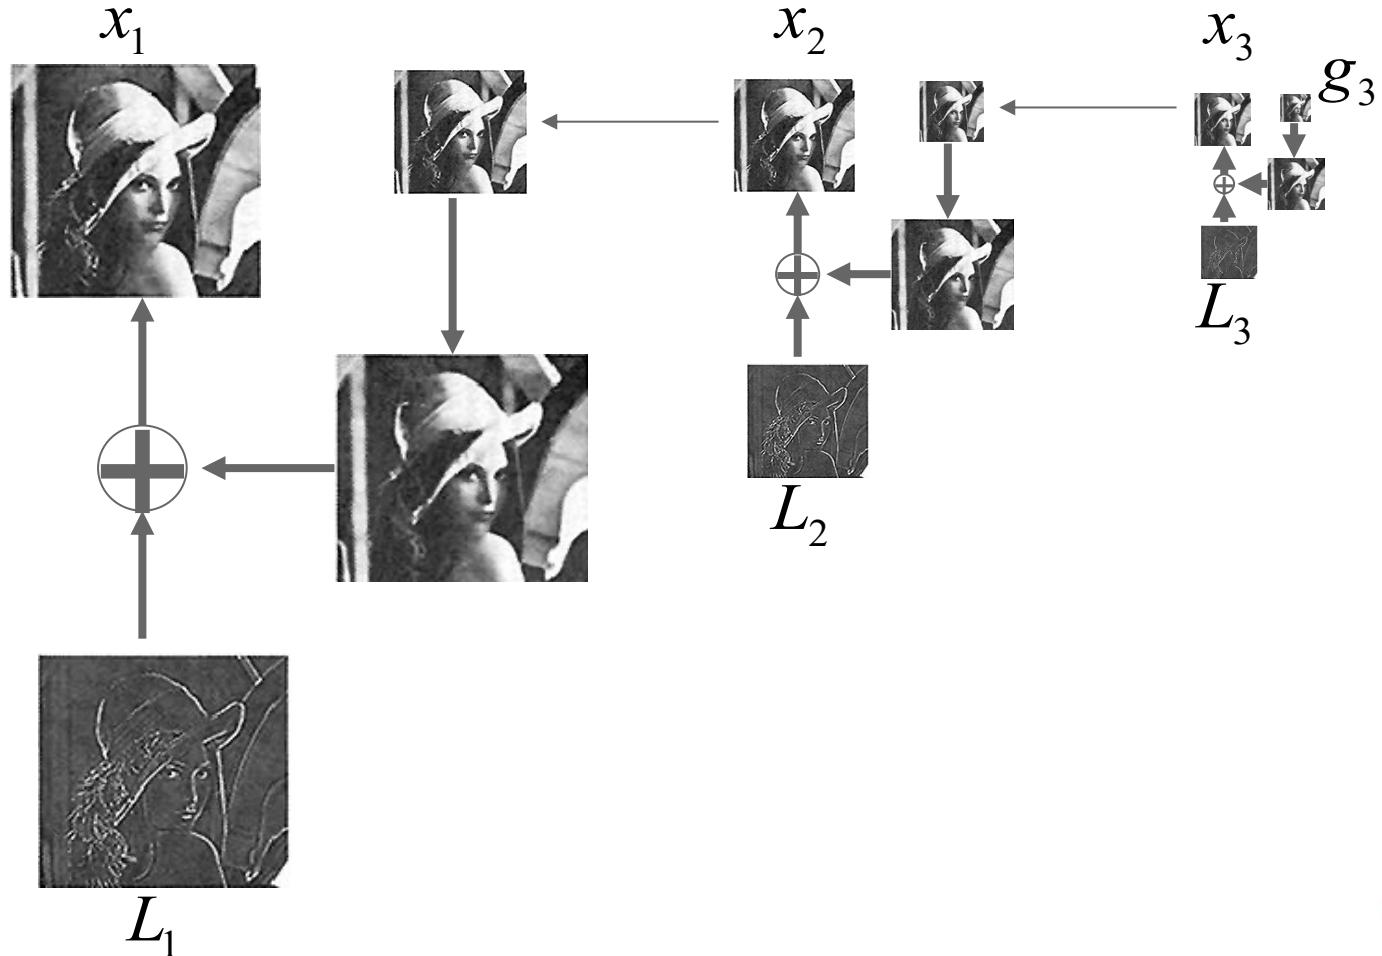

Fig. 5. First four levels of the Gaussian and Laplacian pyramid. Gaussian images, upper row, were obtained by expanding pyramid arrays (Fig. 4) through Gaussian interpolation. Each level of the Laplacian pyramid is the difference between the corresponding and next higher levels of the

Laplacian Pyramid

- Reconstruction: recover x_1 from L_1 , L_2 , L_3 and g_3

Laplacian Pyramid Reconstruction algorithm

G# is the blur-and-downsample operator at pyramid level #
F# is the blur-and-upsample operator at pyramid level #

Laplacian pyramid elements:

$$L_1 = (I - F_1 G_1) x_1$$

$$x_2 = G_1 x_1$$

$$L_2 = (I - F_2 G_2) x_2$$

$$x_3 = G_2 x_2$$

$$L_3 = (I - F_3 G_3) x_3$$

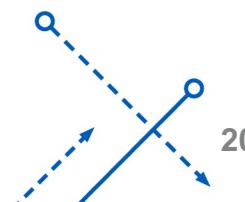

$$x_4 = G_3 x_3$$

Reconstruction of original image (x_1) from Laplacian pyramid elements:

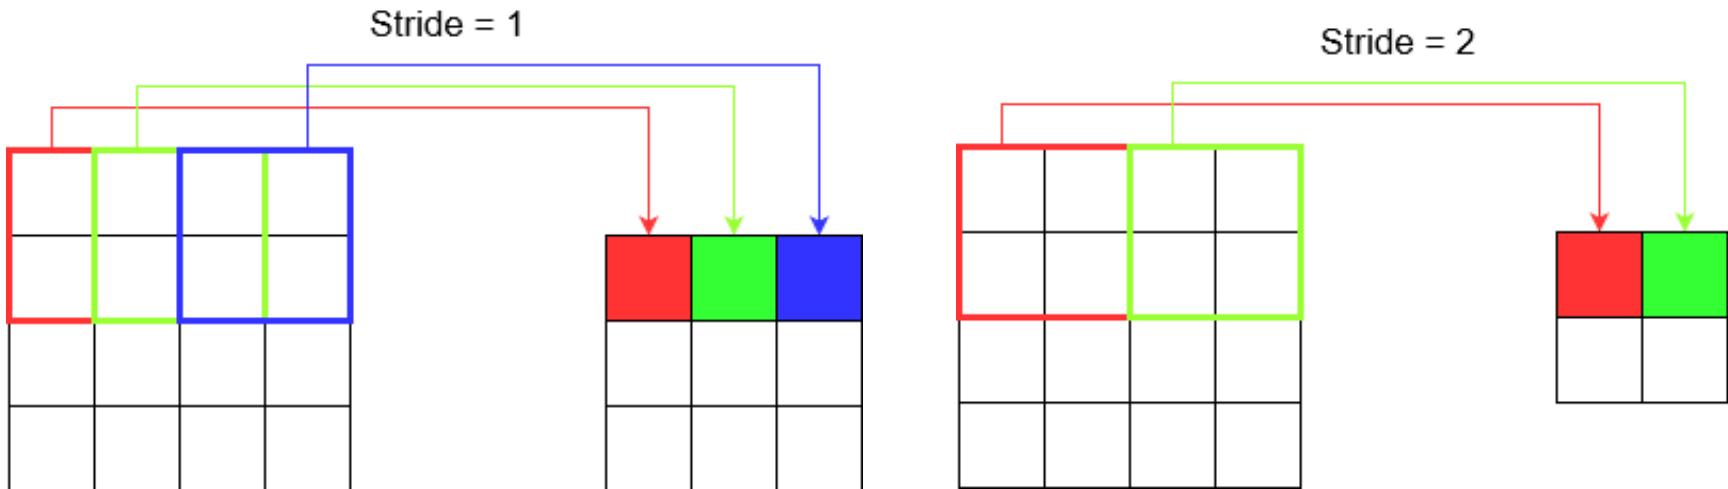

$$x_3 = L_3 + F_3 x_4$$

$$x_2 = L_2 + F_2 x_3$$

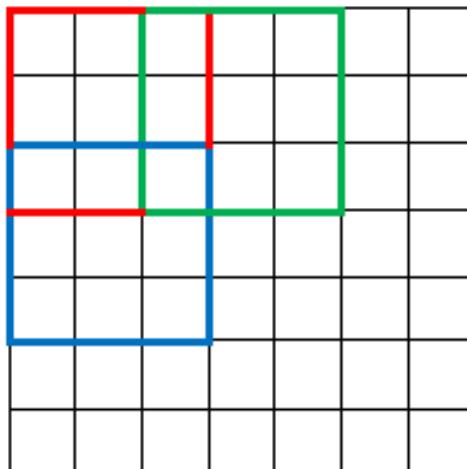

$$x_1 = L_1 + F_1 x_2$$

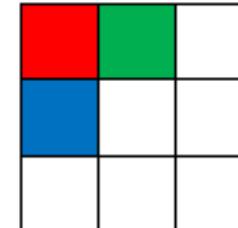

Convolution for Down-sampling

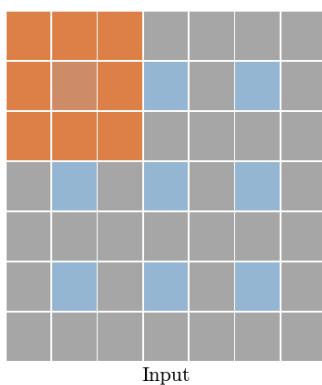

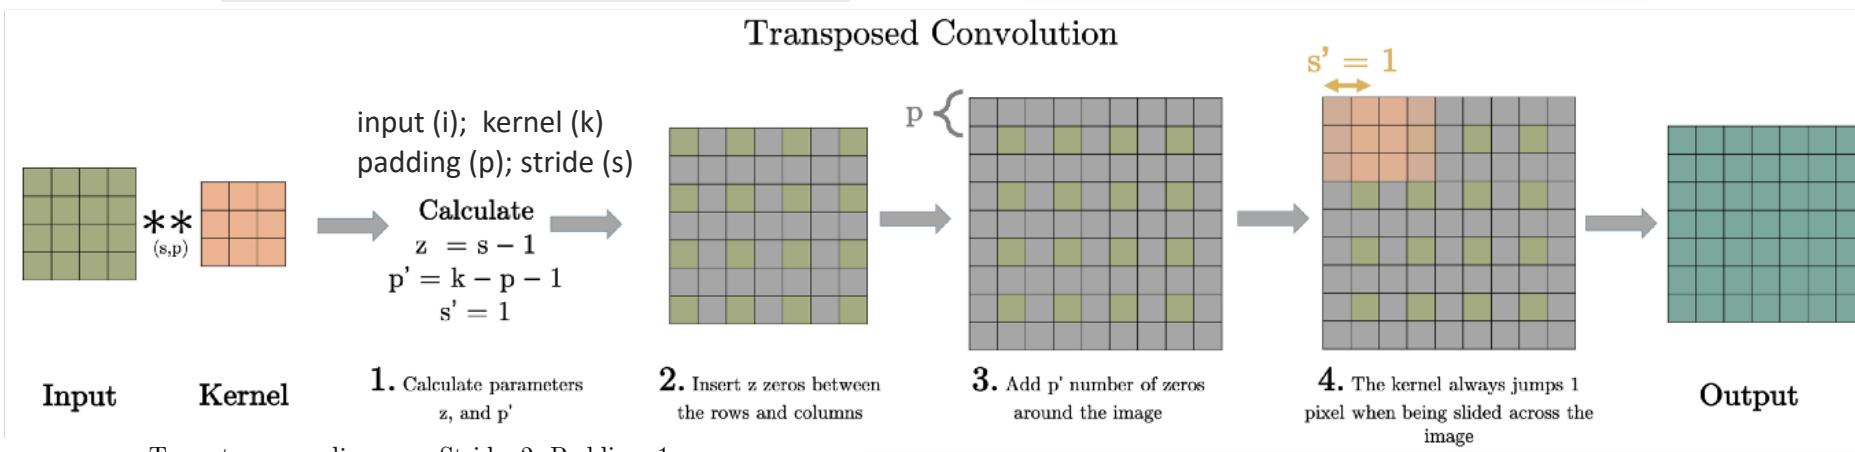

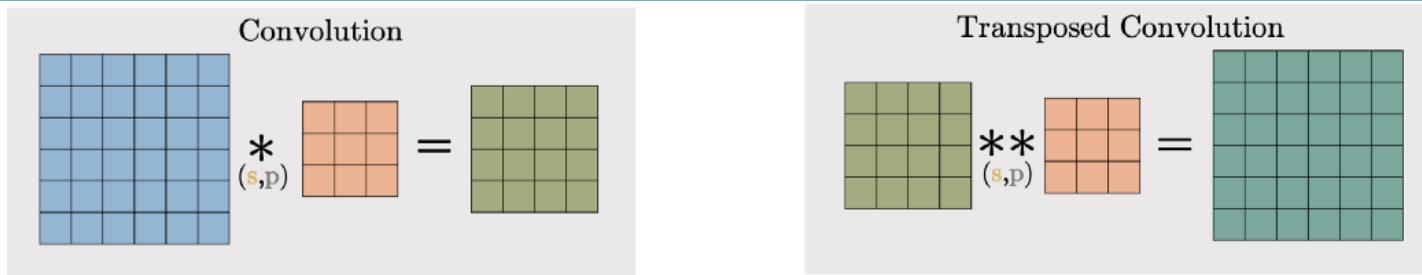

7 x 7 Input Volume

3 x 3 Output Volume

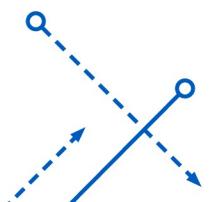

Transposed Convolution for Up-sampling

```
import torch, torch.nn.functional as F
```

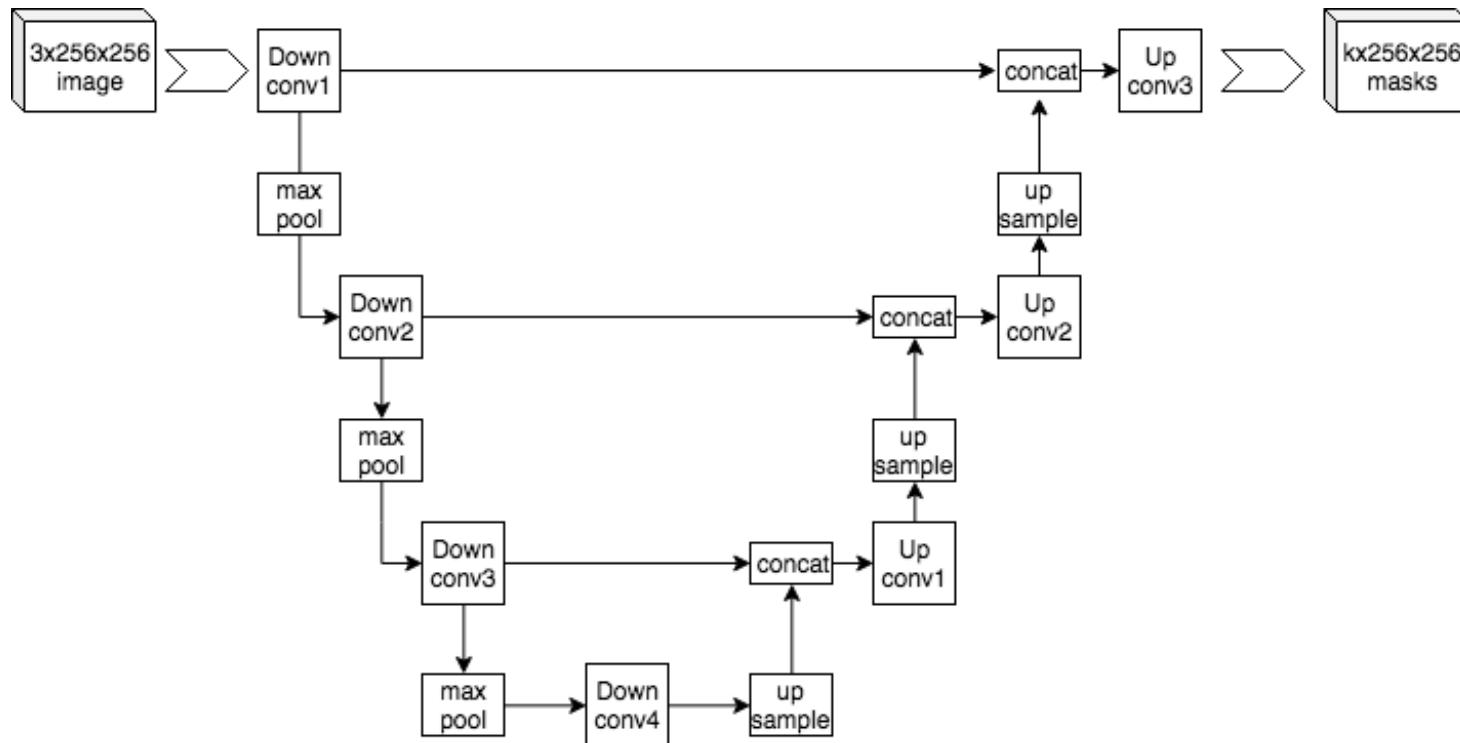

```
inputs = torch.randn(2, 4, 5, 5)
kernel = torch.randn(4, 8, 3, 3)
F.conv_transpose2d(inputs, kernel, stride=2, padding=1)
```

Guess the shape of output. (2, 8, 9, 9)

Why use these representations?

- Handle real-world size variations
- Remove noise, Analyze texture
- Recognize objects, Label image features

Shelhamer E, Long J, Darrell T (April 2017). "Fully Convolutional Networks for Semantic Segmentation". *IEEE Transactions on Pattern Analysis and Machine Intelligence*. **39** (4): 640–651

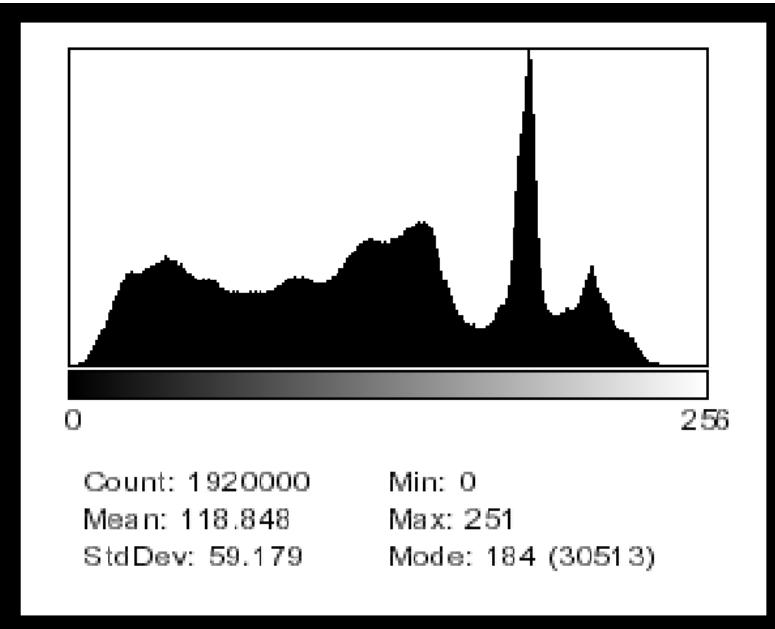

IMAGE PROCESSING

Histogram

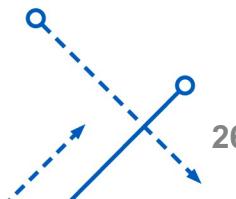

Histogram

- Histograms plots how many times (frequency) each intensity value in image occurs
 - Image (left) has 256 distinct gray levels (8 bits)
 - Histogram (right) shows frequency (how many times) each gray level occurs

Histogram

- Many cameras display real time histograms of scene
 - Helps avoid taking over-exposed pictures

Histogram

- A histogram for a grayscale image with intensity values in range

$$I(u, v) \in [0, K - 1]$$

- would contain exactly K entries
- For 8-bit grayscale image, $K = 2^8 = 256$
- Each histogram entry is defined as:
 - $h(i)$ = number of pixels with intensity i ($0 < i < K$).
 - $h(255)$ = number of pixels with intensity $i = 255$.

Formal definition

$$h(i) = \text{card}\{(u, v) \mid I(u, v) = i\}$$

Number (size of set) of pixels

such that

Normalized Histogram

Histogram $h(r_k) = n_k$

r_k is the k^{th} intensity value

n_k is the number of pixels in the image with intensity r_k

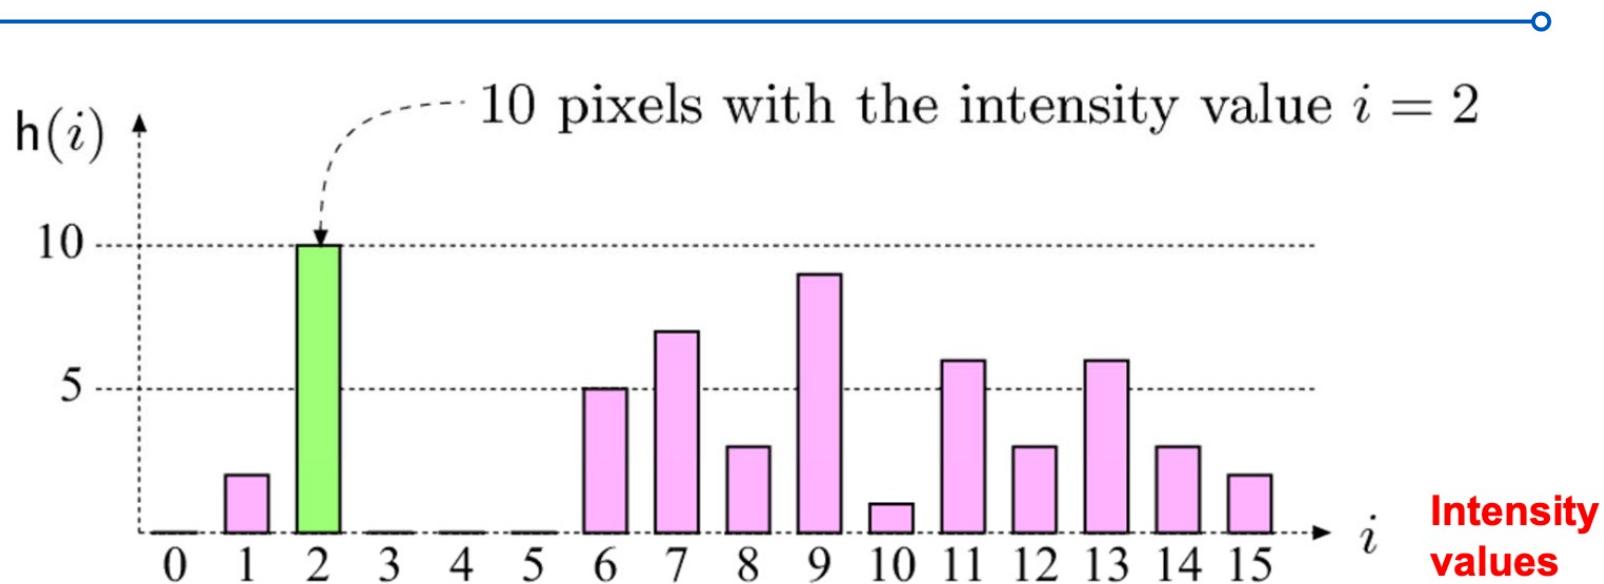

Normalized histogram $p(r_k) = \frac{n_k}{MN}$

n_k : the number of pixels in the image of size $M \times N$ with intensity r_k

Probability density function

Histogram

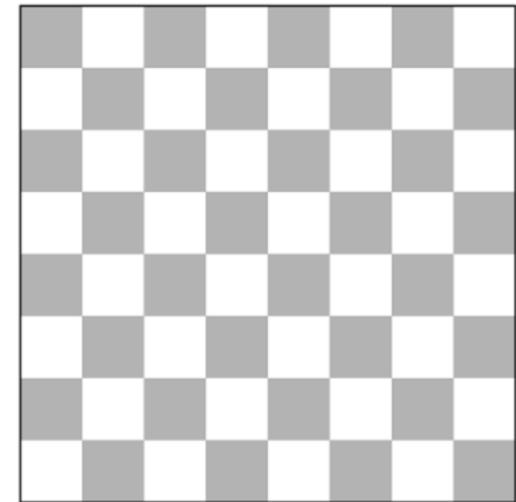

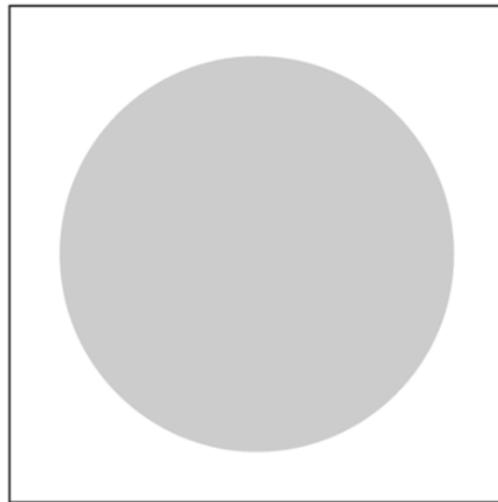

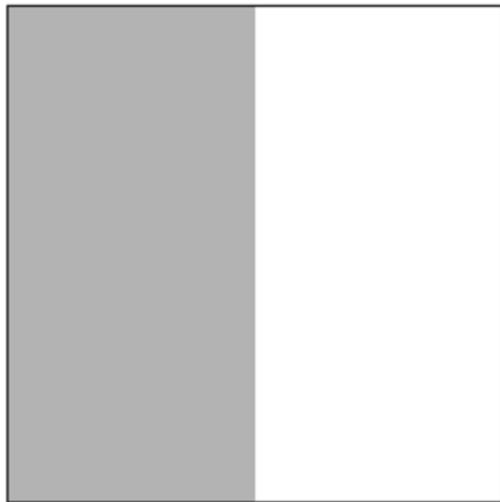

$h(i)$	0	2	10	0	0	0	5	7	3	9	1	6	3	6	3	2
i	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

- E.g., $K = 16$, 10 pixels have intensity value = 2
- Histograms: only statistical information
- No indication of location of pixels

Histogram

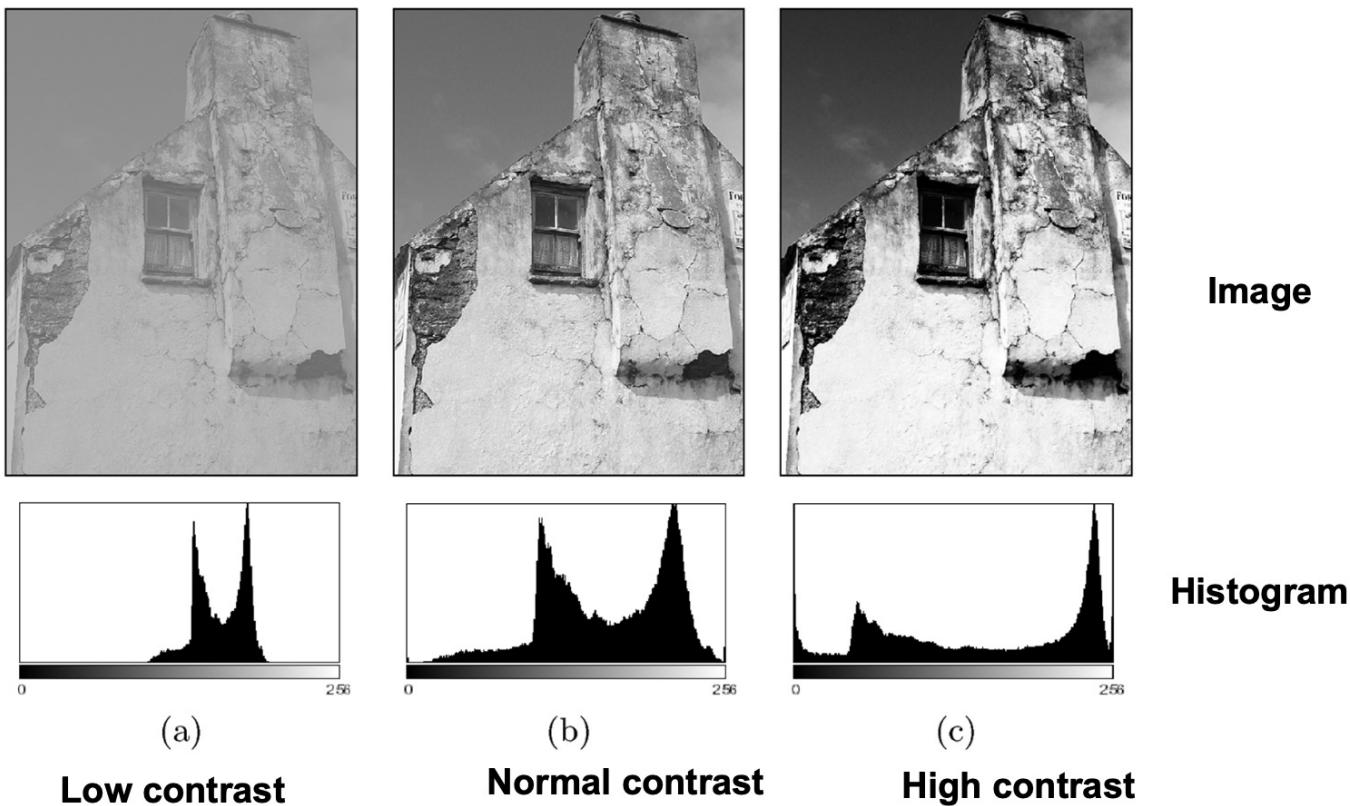

- Different images can have same histogram
- 3 images below have same histogram

- Half of pixels are gray, half are white
 - Same histogram = same statistics
 - Distribution of intensities could be different
- Can we reconstruct image from histogram? No!

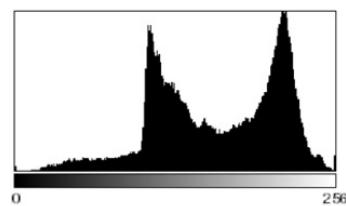

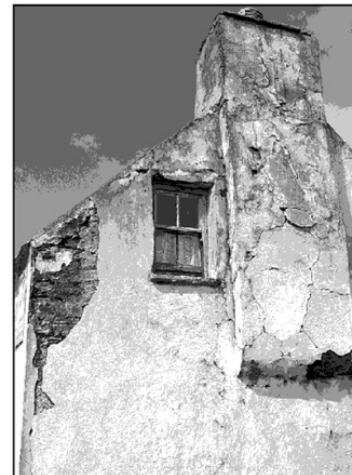

Histogram and Contrast

- What is Good Contrast?
 - Widely spread intensity values
 - Large difference between min and max intensity

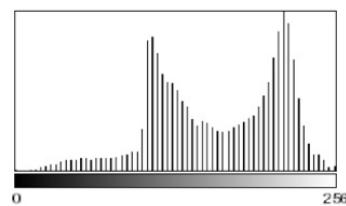

Histogram and Dynamic Range

- Dynamic Range: number of distinct pixels in image
 - High dynamic range means very bright and very dark parts in a single image (many distinct values)

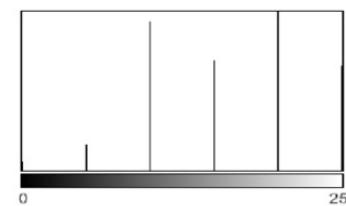

(a)

High Dynamic Range

(b)

**Low Dynamic Range
(64 intensities)**

(c)

**Extremely low
Dynamic Range
(6 intensity values)**

Large Histograms: Binning

- High resolution image can yield very large histogram
- E.g., 32-bit image = $2^{32} = 4,294,967,296$ columns
 - Such a large histogram impractical to display
- Solution is Binning
 - Combine ranges of values into histogram columns

So, given the image $I : \Omega \rightarrow [0, K - 1]$, the binned histogram for I is the function

$$h(i) = \text{card}\{(u, v) \mid a_i \leq I(u, v) < a_{i+1}\},$$

$$\text{where } 0 = a_0 < a_1 < \dots < a_B = K.$$

Number (size of set) of pixels

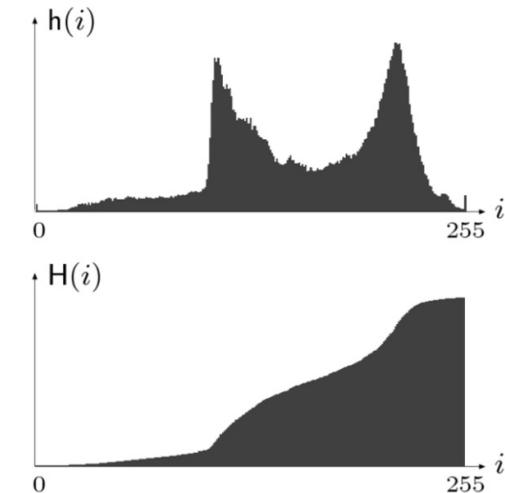

such that

Pixel's intensity is
between a_i and a_{i+1}

Cumulative Histogram

- Useful for histogram equalization (introducing later)
- Similar to the Cumulative Density Function (CDF)
- Definition

$$H(i) = \sum_{j=0}^i h(j) \quad \text{for } 0 \leq i < K$$

- Monotonically increasing

$$H(K-1) = \sum_{j=0}^{K-1} h(j) = M \cdot N$$

Last entry of
Cum. histogram

Total number of
pixels in image

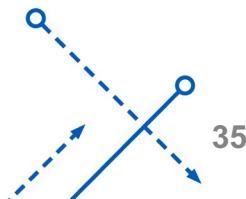

Point Operation

- Point operations changes a pixel's intensity value.

$$a' \leftarrow f(a)$$

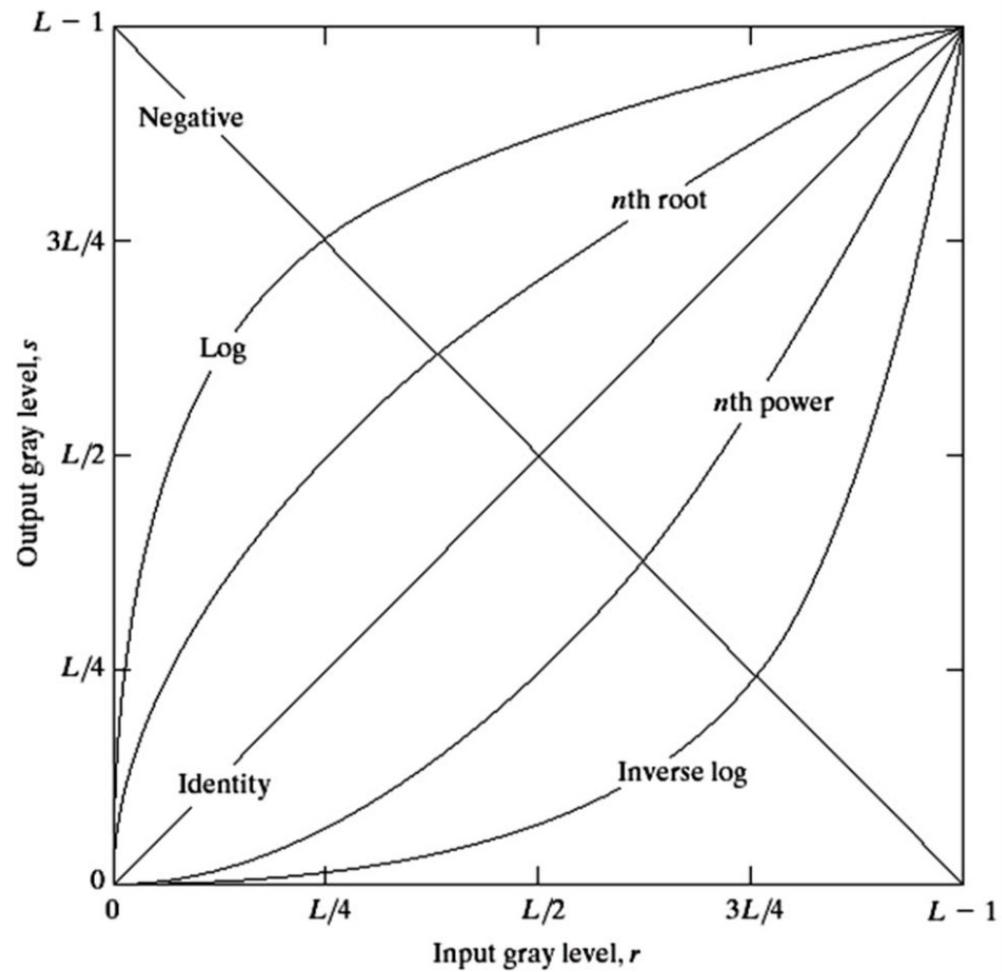

$$I'(u, v) \leftarrow f(I(u, v))$$

- New pixel intensity depends on
 - Pixel's previous intensity $I(u, v)$
 - Mapping function $f()$
- Does not depend on
 - Pixel's location (u, v)
 - Intensities of neighboring pixels

Basic Grey Level Point Operation

- 3 most common gray level operation
 - Linear
 - Negative/Identity
 - Logarithmic
 - Log/Inverse log
 - Power law
 - nth power/nth root

Power Law Transformations

- Power law transformations have the form

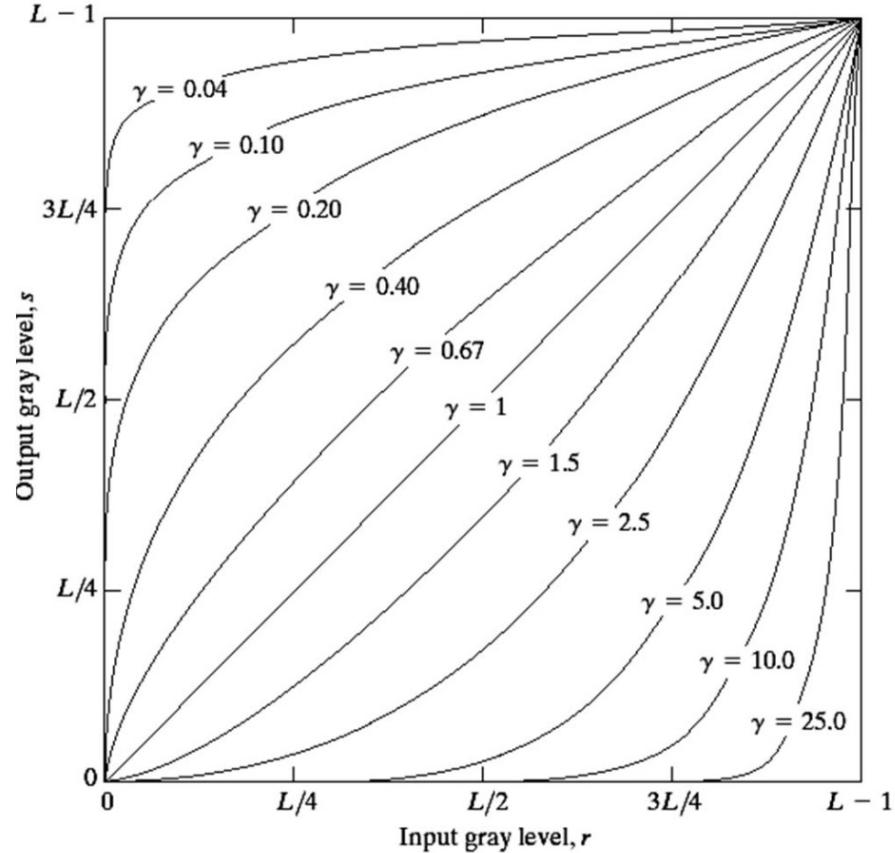

$$s = c * r^\gamma$$

Annotations:

- New pixel value (s)
- Constant (c)
- Old pixel value (r)
- Power (γ)

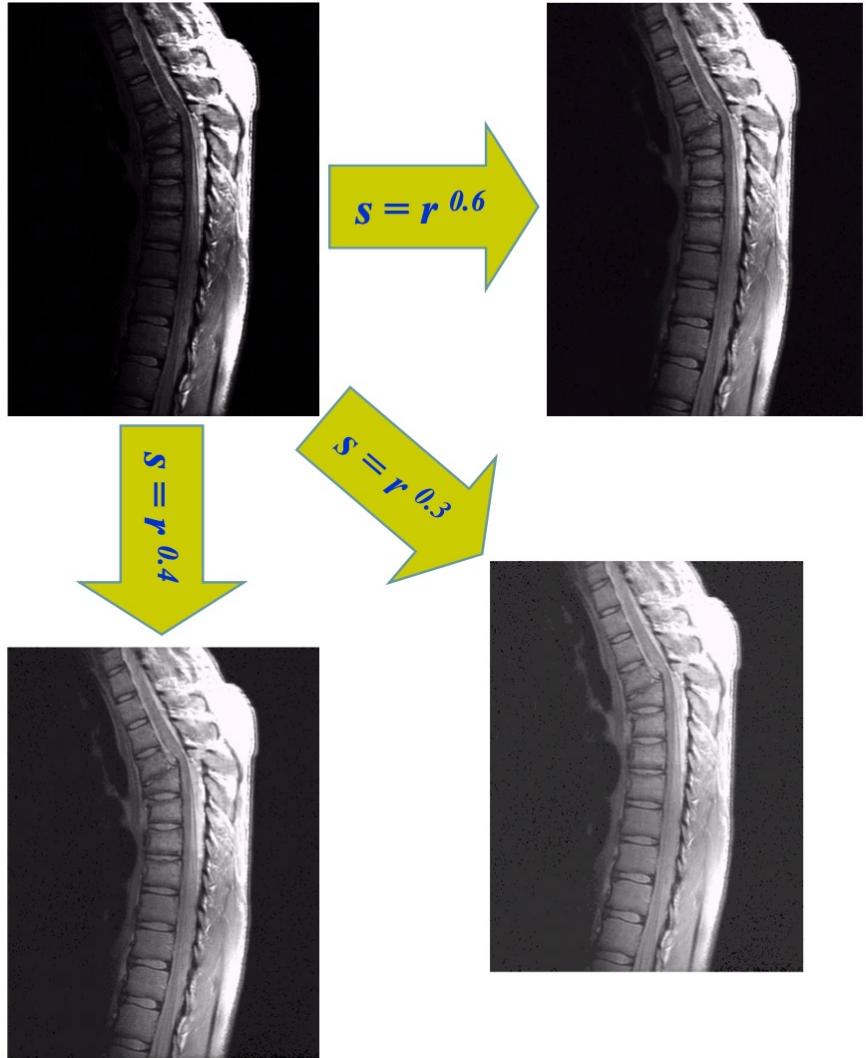

- Map narrow range of dark input values into wider range of output values or vice versa

- Varying γ gives a whole family of curves

Power Law Example

- Magnetic Resonance (MR) image of fractured human spine

- Different power values highlight different details

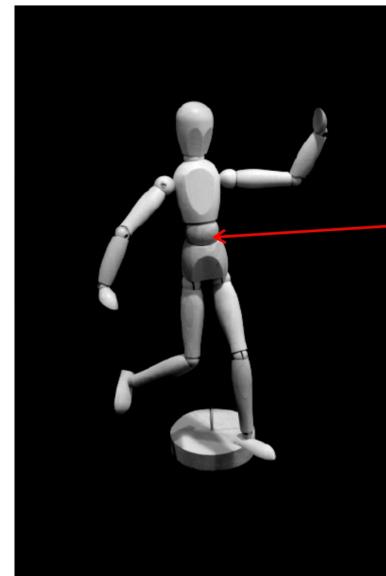

Intensity Windowing

- A clamp operation, then linearly stretching image intensities to fill possible range
- To window an image in $[a,b]$ with max intensity M

$$f(p) = \begin{cases} 0 & \text{if } p < a \\ M \times \frac{p-a}{b-a} & \text{if } a \leq p \leq b \\ M & \text{if } p > b \end{cases}$$

Original Image

Windowed Image

Automatic Contrast Adjustment

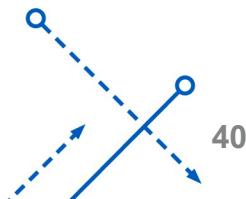

- Modify pixel intensities such that the available range of range of pixels is full covered.
- Algorithm
 - Find high and lowest pixel intensities, a_{low} and a_{high}
 - Linear stretching the intensity range.

$$f_{\text{ac}}(a) = a_{\min} + (a - a_{\min}) \cdot \frac{a_{\max} - a_{\min}}{a_{\text{high}} - a_{\text{low}}}$$

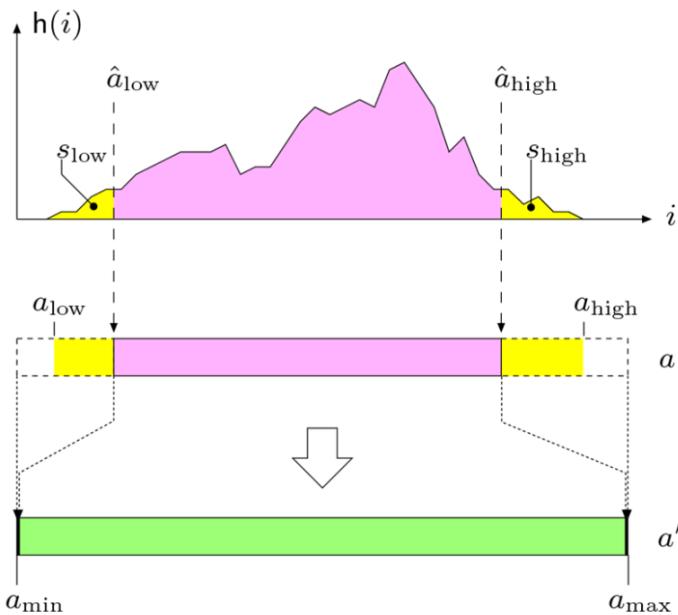

If $a_{\min} = 0$ and $a_{\max} = 255$

$$f_{\text{ac}}(a) = (a - a_{\min}) \cdot \frac{255}{a_{\text{high}} - a_{\min}}$$

Modified Contrast Adjustment

- Better to map only certain range of values.
- Get rid of tails (usually noises), with predefined percentiles s_{low} and s_{high}

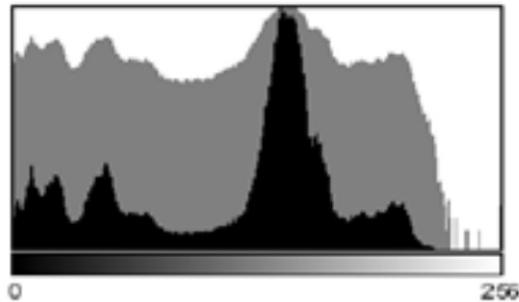

$$\hat{a}_{\text{low}} = \min \{ i \mid H(i) \geq M \cdot N \cdot s_{\text{low}} \}$$

$$\hat{a}_{\text{high}} = \max \{ i \mid H(i) \leq M \cdot N \cdot (1 - s_{\text{high}}) \}$$

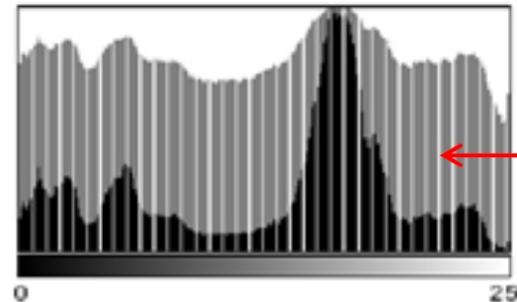

$$f_{\text{mac}}(a) = \begin{cases} a_{\text{min}} & \text{for } a \leq \hat{a}_{\text{low}} \\ a_{\text{min}} + (a - \hat{a}_{\text{low}}) \cdot \frac{a_{\text{max}} - a_{\text{min}}}{\hat{a}_{\text{high}} - \hat{a}_{\text{low}}} & \text{for } \hat{a}_{\text{low}} < a < \hat{a}_{\text{high}} \\ a_{\text{max}} & \text{for } a \geq \hat{a}_{\text{high}} \end{cases}$$

Effects of Automatic Contrast Adjustment

(a)

Original

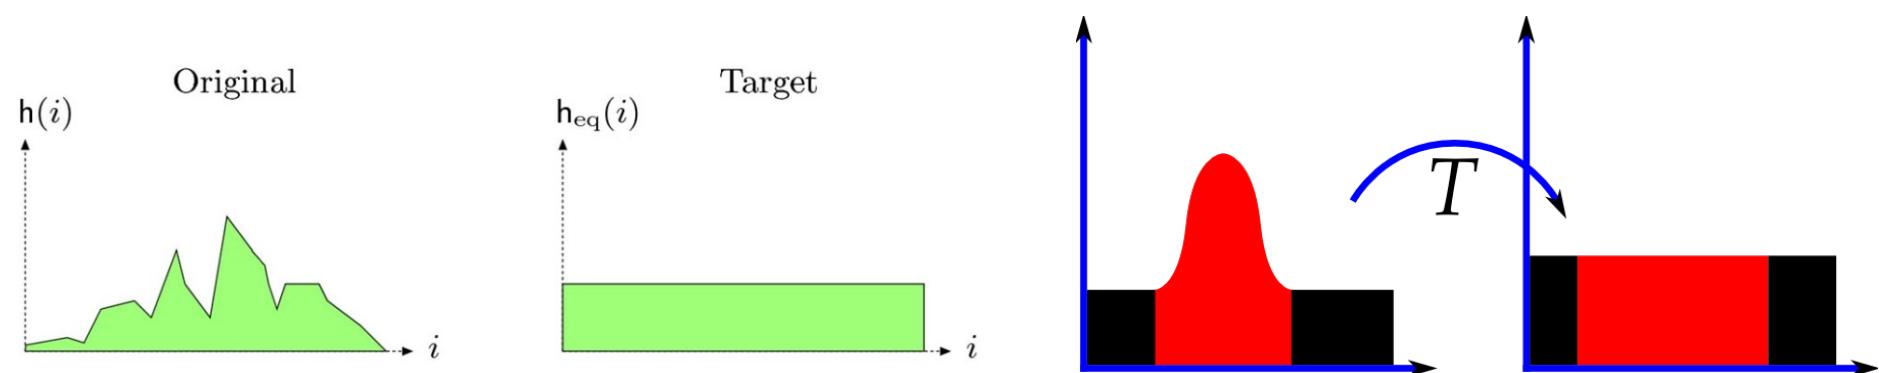

(b)

Result of automatic
Contrast Adjustment

Linearily stretching
range causes gaps
in histogram

Histogram Equalization

- Adjust 2 different images to make their histograms (intensity distributions) similar
- Apply a point operation that changes histogram of modified image into uniform distribution.

Histogram Equalization: Algorithm

- Normalized Histogram

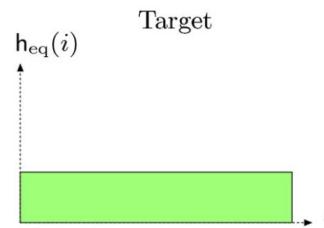

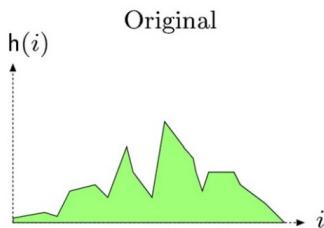

$$p_x(i) = p(x = i) = \frac{n_i}{n}, \quad 0 \leq i < L$$

- Cumulated Normalized Histogram

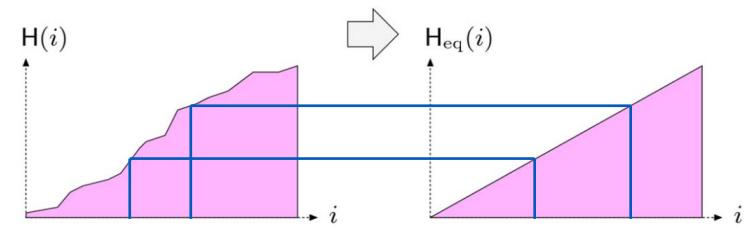

$$\text{cdf}_x(i) = \sum_{j=0}^i p_x(x = j),$$

- A transform for histogram equalization, WHY?

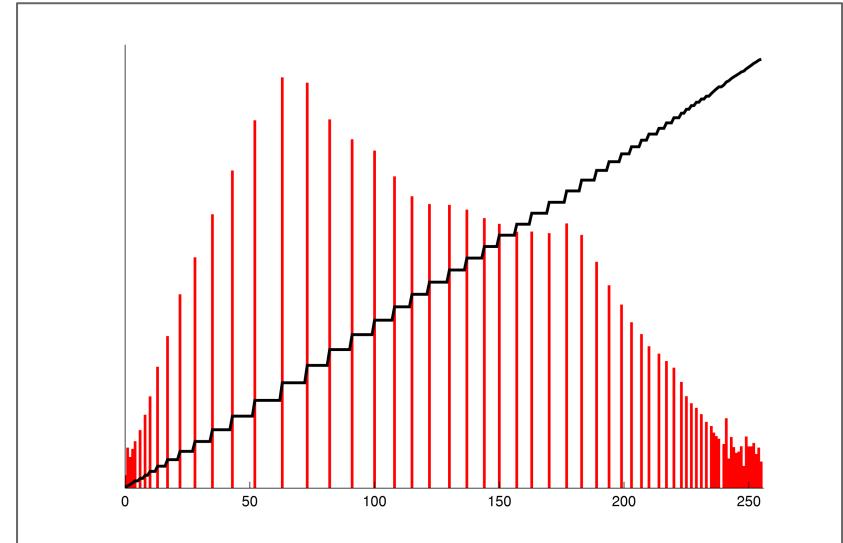

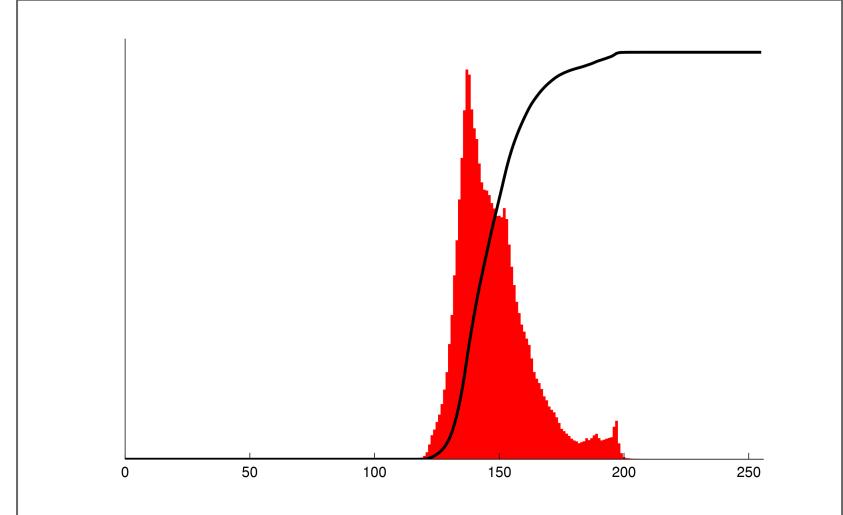

$$y = T(k) = \text{cdf}_x(k)$$

Cumulative
Histogram
